# Assumptions

Everything will be countable; in particular, all languages, theories, and models are countable.

Theories will be complete (except when they're not), and taken to have only infinite models.

# Types

Let  $p(\bar{x})$  be a collection of  $\mathcal{L}$ -formulas having variables among  $x_0, \dots, x_{n-1}$  for some fixed  $n$ .

- $p(\bar{x})$  is an *n-type of  $T$*  if there is a model  $\mathcal{M}$  of  $T$ , and an element  $\bar{a}$  in the universe of that model so that every formula in  $p(\bar{x})$  is true of  $\bar{a}$  in  $\mathcal{M}$ . We say  $p(\bar{x})$  is *realized by  $\bar{a}$  in  $\mathcal{M}$* .
- $p(\bar{x})$  is a *complete n-type of  $T$*  if it is a maximal consistent set of  $n$ -ary formulas.
- Given an  $\mathcal{L}$ -structure  $\mathcal{M} \models T$  and an element  $\bar{a}$  of its universe, the *type of  $\bar{a}$  in  $\mathcal{M}$* ,  
 $\text{tp}_{\mathcal{M}}(\bar{a}) = \{\theta(\bar{x}) \mid \theta(\bar{a}) \text{ is true in } \mathcal{M}\}.$

# Type Space

- The collection of all complete  $n$ -types is  $S_n(T)$ .
- We can put a topology on this space... the basic open sets are given by the  $n$ -ary  $\mathcal{L}$ -formulas, that is, for an  $n$ -ary  $\mathcal{L}$ -formula  $\varphi(\bar{x})$ , we have the basic open set

$$\{p \in S_n(T) \mid \varphi(\bar{x}) \in p\}.$$

- With this topology,  $S_n(T)$  is a totally disconnected space, compact, and Hausdorff. (Such a space is called Boolean.)

# Type Space

$S_n(T)$  can be viewed as the set of all paths in a tree:

- Let  $\{\theta_i(\bar{x})\}_{i \in \omega}$  be an enumeration of all  $n$ -ary formulas of  $\mathcal{L}$ .
- Let  $\theta^1 = \theta$  and  $\theta^0 = \neg\theta$ .
- For  $\alpha \in 2^{<\omega}$ , let  $\theta_\alpha(\bar{x}) = \bigwedge_{i < |\alpha|} \{\theta_i^{\alpha(i)}(\bar{x})\}$ .
- Define the tree of  $n$ -ary formulas consistent with  $T$  as

$$\mathcal{T}_n(T) = \{\theta_\alpha(\bar{x}) \mid \alpha \in 2^{<\omega} \text{ \& } (\exists \bar{x}) \theta(\bar{x}) \in T\}.$$

- Paths in  $\mathcal{T}_n(T)$  are complete  $n$ -types of  $T$ .

# Type Space

Note that we identify formulas with their indices when convenient.

- A node,  $\alpha$  is an *atom* if it does not split. Paths passing through atoms are *isolated* or *principle* paths. These correspond to formulas which generate *principle types*.
- $\mathcal{T}$  is *atomic* if every node in  $\mathcal{T}$  is extended by an atom, equivalently, the isolated paths are dense in  $[\mathcal{T}]$ .
- A complete theory,  $T$ , is *atomic* if  $\mathcal{T}_n(T)$  is atomic for every  $n \geq 1$ .
- A node  $\beta$  that cannot be extended to an atom is called *atomless*.

# Warm up example

Let  $T$  be the theory of the rationals as a *DLO* without endpoints, and consider the structure  $\mathcal{Q} = \langle \mathbb{Q}; <, c_q \rangle_{q \in \mathbb{Q}}$ .

- Countably many isolated types. (Corresponding to generators of the form  $x = c_q$  for  $q \in \mathbb{Q}$ .)
- Uncountably many non-principal types. (Corresponding to the cuts of the rationals.)
- $T$  is atomic as the principal types are dense.

# Homogeneous models

## Definition

An  $\mathcal{L}$ -structure  $\mathcal{M}$  is called *homogeneous* if for any two finite tuples,  $\bar{a}$  and  $\bar{b}$ , in  $M$  we have

$$\langle \mathcal{M}, \bar{a} \rangle \equiv \langle \mathcal{M}, \bar{b} \rangle \implies (\forall c \in M)(\exists d \in M)[\langle \mathcal{M}, \bar{a}, c \rangle \equiv \langle \mathcal{M}, \bar{b}, d \rangle].$$

## Facts

- It is equivalent to say that any finite elementary map can be extended to an automorphism.
- Any two homogeneous models of the same cardinality that realize the same types are isomorphic.
- Any countable theory has a homogeneous model.

# Prime and Atomic models

## Definition

- $\mathcal{M} \models T$  is *prime* if  $\mathcal{M}$  can be elementarily embedded in any other model of  $T$ .
- $\mathcal{M}$  is *atomic* if all the types realized by  $\mathcal{M}$  are principle.

## Facts

- $\mathcal{M}$  is prime iff it is countable and atomic.
- If  $\mathcal{M}$  is prime (and hence atomic), it is homogeneous.
- If  $\mathcal{M}_1$  and  $\mathcal{M}_2$  are both prime models of  $T$ , they are isomorphic.
- If  $T$  is countable, complete, has infinite models, and is atomic, then it has a prime model.

# Saturated models

## Definition

Let  $\mathcal{M}$  be a countable model of  $T$ .

- ①  $\mathcal{M}$  is *saturated* if every 1-type  $p(\bar{a}, x)$  over a finite set of elements  $\bar{a} \in M$  is realized in  $\mathcal{M}$ .
- ②  $\mathcal{M}$  is *weakly saturated* if every  $n$ -type of  $T$  is realized in  $\mathcal{M}$ .
- ③  $\mathcal{M}$  is  $\omega$ -*universal* if  $\mathcal{N} \preceq \mathcal{M}$  for every countable model  $\mathcal{N}$  of  $T$ .

# Saturated models

## Facts

- The following are equivalent:
  - $\mathcal{M}$  is saturated.
  - $\mathcal{M}$  is weakly saturated and homogeneous.
  - $\mathcal{M}$  is  $\omega$ -universal and homogeneous.
- If  $\mathcal{M}_1$  and  $\mathcal{M}_2$  are countable and saturated, they are isomorphic.
- A theory has a countable saturated model iff  $S_n(T)$  is countable for all  $n$ .

## Homogeneous Models

- Decidable copies of homogeneous models
- Undecidable copies of homogeneous models
- Degrees bounding homogeneous models

Let  $T$  be a complete, atomic, decidable (CAD) theory.

### Theorem (Millar)

There is CAD theory with no decidable prime model.

### Theorem (Goncharov-Nurtazin, Harrington; 1973, 1974)

The following are equivalent:

- $T$  has a decidable prime model.
- The collection of principal types,  $S^P(T)$ , has a  $\mathbf{0}$ -basis.
- $(\exists g \leq_T \mathbf{0})(\forall \theta_\alpha \in \mathcal{T}_n(T))[\theta_\alpha \subset g_\alpha \in S_n^P(T)]$ , where  $g_\alpha(y) = g(\alpha, y)$  is an element of  $[\mathcal{T}_n(T)]$ .

## Theorem

If  $T$  is *CAD*, then it has a prime model decidable in  $\mathbf{0}'$ .

## Theorem (Csimá)

If  $T$  is a *CAD* then it has a low prime model.

# A theorem about trees...

## Theorem (Hirschfeldt, 2006)

If  $\mathcal{T}$  is an extendible ‘paths all computable’ (*PAC*) tree, and  $D >_{\mathcal{T}} \emptyset$ , then there is a  $D$ -computable listing of all the isolated paths in  $[\mathcal{T}]$ .

# Consequences for prime models

## Corollary

If  $T$  is *CAD* and all its types are computable (*TAC*), and  $D >_T \emptyset$ , then  $T$  has a  $D$ -decidable prime model.

## Corollary

If  $\mathbf{0} \notin dgSp(\mathcal{M})$ , and  $\mathcal{M}$  is prime, then  $dgSp(\mathcal{M}) = \{\mathbf{d} \mid \mathbf{d} > \mathbf{0}\}$ .

## Corollary (Slaman, Wehner)

There is a structure with presentations of every non-zero degree, but no computable presentation.

# More reminders...

- The function  $g$  dominates  $f$  ( $f <^* g$ ) if  $(\forall^\infty x)[f(x) < g(x)]$ .
- $f$  escapes  $g$  if  $f \not<^* g$ , that is,  $(\exists^\infty x)[g(x) \leq f(x)]$ .
- $f$  is dominant if  $f$  dominates every computable function.

These definitions extend naturally to degrees.

## Theorem (Martin)

A degree  $\mathbf{d}$  is high ( $\mathbf{d}' = \mathbf{0}''$ ) iff  $\exists$  dominant  $g \leq_T \mathbf{d}$ .

Relativizing yields a characterization of the  $\text{nonlow}_2$  sets:

## Theorem ( $\text{Nonlow}_2$ escape theorem)

Degree  $\mathbf{a} \leq \mathbf{0}'$  is not  $\text{low}_2$ , ( $\mathbf{a}'' > \mathbf{0}''$ ) iff  $\mathbf{0}'$  does not dominate  $\mathbf{a}$ .

# More reminders...

- A set  $X$  is said to have the *escape property* if

$$(\forall g \leq_T 0')(\exists f \leq_T X)(\exists^\infty x)[g(x) \leq f(x)],$$

that is, for any  $\Delta_2^0$  function, we can find an  $X$ -computable function  $f$  that escapes it.

- $X$  (or the degree of  $X$ ) has the *prime bounding property* if every  $CAD$  theory has an  $X$ -decidable prime model.

# Back to the matter at hand.

## Theorem (Csima, Hirschfeldt, Knight, Soare; 2004)

For  $X \leq_T 0'$ , the following are equivalent:

- $X$  has the escape property.
- $X$  is not  $\text{low}_2$ .
- $X$  is prime bounding.

# Outline

## 1 Review

## 2 Prime Models

- Decidable prime models
- Undecidable prime models
- Degrees bounding prime models

## 3 Saturated Models

- Decidable saturated models
- Undecidable saturated models
- Degrees bounding saturated models

## 4 Homogeneous Models

- Decidable copies of homogeneous models
- Undecidable copies of homogeneous models
- Degrees bounding homogeneous models

Let  $T$  be complete decidable ( $CD$ ) with all its types computable ( $TAC$ ).

### Theorem (Millar)

There is a  $CD$ ,  $TAC$  theory having no decidable saturated model.

### Theorem (Morley, Millar; 1978)

The following are equivalent:

- $T$  has a decidable saturated model.
- There is a computable listing of the types of  $T$ ,  $S(T)$ , that is,  $S(T)$  has a **0**-basis.

## Theorem (Harris)

There is a *CD*, *TAC* theory having no low saturated model.

## Theorem

$T$  has a saturated model computable in  $\emptyset'$ .

# Positive results

A set  $X$  (or its degree) is called *saturated bounding* if every CD, TAC theory has an  $X$ -decidable saturated model.

If  $\mathbf{d}$  is the degree of a complete extension of Peano Arithmetic, it is a *PA* degree.

## Theorem (Macintyre, Marker; 1984)

Every *PA* degree is saturated bounding.

## Theorem (Harris; to appear)

Every high degree is saturated bounding.

# Proof that high degrees are saturated bounding.

Another tree theorem:

## Theorem

Let  $\mathcal{T}$  be an extendible *PAC* tree, and  $\mathbf{d}$  a high degree. There is a  $\mathbf{d}$ -uniform listing of  $[\mathcal{T}]$ .

To show this, we need a theorem from computability:

## Theorem (Jockusch)

If  $\mathbf{d}$  is a high degree, there is a  $\mathbf{d}$ -uniform listing of the computable functions.

# Negative results

## Theorem (Harris)

No  $\text{low}_n$  degree is saturated bounding.

# Outline

## 1 Review

- Type Space,  $S(T)$
- Vaughtian models, definitions and basic facts

## 2 Prime Models

- Decidable prime models
- Undecidable prime models
- Degrees bounding prime models

## 3 Saturated Models

- Decidable saturated models
- Undecidable saturated models
- Degrees bounding saturated models

## 4 Homogeneous Models

- Decidable copies of homogeneous models
- Undecidable copies of homogeneous models
- Degrees bounding homogeneous models

**Theorem (Goncharov, Peretyat'kin, Millar; 1978, 1978, 1980)**

There is a *CD* theory having a homogeneous model with a **0**-basis, but no decidable copy.

**Theorem (Goncharov, Peretyat'kin; 1978, 1978)**

If  $\mathcal{M}$  is a homogeneous model of a *CD* theory that has a **0**-basis  $X = \{p_i(\bar{x})\}_{i \in \omega}$  and an *effective extension function* for  $X$  then  $\mathcal{M}$  has a decidable copy.

An *effective extension function* is a computable binary function  $f$  taking the  $n$ -type  $p_i(\bar{x})$  and a (consistent)  $(n+1)$ -ary formula  $\theta_j(\bar{x}, x_n)$  to an  $(n+1)$ -type,  $p_{f(i,j)}$  that extends both, that is  $p_i(\bar{x}) \cup \{\theta_j(\bar{x}, x_n)\} \subseteq p_{f(i,j)}(\bar{x}, x_n)$ .

## Theorem (Lange)

If  $\mathcal{M}$  is a homogeneous model of a *CD* theory  $T$ , and  $X = S(\mathcal{M})$  is a  $\mathbf{0}'$ -basis for the types of  $\mathcal{M}$ , then  $\mathcal{M}$  has a copy  $\mathcal{N}$  that is low ( $D^e(\mathcal{N})' \equiv_T \mathbf{0}'$ ).

## Theorem (Lange)

Let  $T$  be a *CD* theory with homogeneous model  $\mathcal{M}$  having  $\mathbf{0}$ -basis  $X$ . If  $\mathbf{d} \leq \mathbf{0}'$  is nonlow<sub>2</sub>, then there is a  $\mathbf{d}$ -decidable copy of  $\mathcal{M}$ .

## Theorem (Lange)

Let  $T$  be a *CD*, *TAC* theory. Let  $\mathcal{M}$  be a homogeneous model of  $T$  with a  $\mathbf{0}$ -basis. Then

$$\{\mathbf{d} \mid \mathbf{0} < \mathbf{d}\} \subseteq \{\deg(\mathcal{N}) \mid \mathcal{N} \cong \mathcal{M}\}.$$

## Degrees bounding homogeneous models

A degree  $\mathbf{d}$  is *homogeneous bounding* if every *CD* theory has a  $\mathbf{d}$ -decidable homogeneous model.

**Theorem (Csima, Harizanov, Hirschfeldt, Soare; to appear)**

A degree is homogeneous bounding iff it is a *PA* degree.
