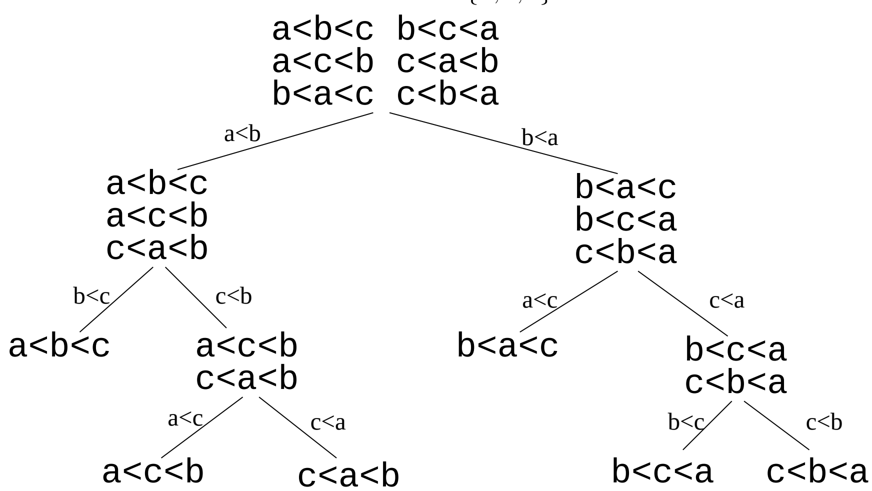
12-0: **Comparison Sorting**

- Comparison sorts work by comparing elements
  - Can only compare 2 elements at a time
  - Check for $<$, $>$, $=$.
- All the sorts we have seen so far (Insertion, Quick, Merge, Heap, etc.) are comparison sorts
- If we know nothing about the list to be sorted, we need to use a comparison sort

12-1: **Decision Trees** Insertion Sort on list $\{a, b, c\}$



12-2: **Decision Trees**

- Every comparison sorting algorithm has a decision tree
- What is the best-case number of comparisons for a comparison sorting algorithm, given the decision tree for the algorithm?

12-3: **Decision Trees**

- Every comparison sorting algorithm has a decision tree
- What is the best-case number of comparisons for a comparison sorting algorithm, given the decision tree for the algorithm?
  - (The depth of the shallowest leaf) + 1
- What is the worst case number of comparisons for a comparison sorting algorithm, given the decision tree for the algorithm?

12-4: **Decision Trees**

- Every comparison sorting algorithm has a decision tree
- What is the best-case number of comparisons for a comparison sorting algorithm, given the decision tree for the algorithm?
  - (The depth of the shallowest leaf) + 1

- What is the worst case number of comparisons for a comparison sorting algorithm, given the decision tree for the algorithm?
    - The height of the tree – (depth of the deepest leaf) + 1

12-5: **Decision Trees**

- What is the largest number of nodes for a tree of depth d?

12-6: **Decision Trees**

- What is the largest number of nodes for a tree of depth d?
    - 2^d
- What is the minimum height, for a tree that has n leaves?

12-7: **Decision Trees**

- What is the largest number of nodes for a tree of depth d?
    - 2^d
- What is the minimum height, for a tree that has n leaves?
    - $\lg n$
- How many leaves are there in a decision tree for sorting n elements?

12-8: **Decision Trees**

- What is the largest number of nodes for a tree of depth d?
    - 2^d
- What is the minimum height, for a tree that has n leaves?
    - $\lg n$
- How many leaves are there in a decision tree for sorting n elements?
    - $n!$
- What is the minimum height, for a decision tree for sorting n elements?

12-9: **Decision Trees**

- What is the largest number of nodes for a tree of depth d?
    - 2^d
- What is the minimum height, for a tree that has n leaves?
    - $\lg n$
- How many leaves are there in a decision tree for sorting n elements?
    - $n!$
- What is the minimum height, for a decision tree for sorting n elements?

- $\lg n!$

12-10: $\lg(n!) \in \Omega(n \lg n)$

$$\begin{aligned}
\lg(n!) &= \lg(n * (n-1) * (n-2) * \ldots * 2 * 1) \\
&= (\lg n) + (\lg(n-1)) + (\lg(n-2)) + \ldots \\
&\quad +(\lg 2) + (\lg 1) \\
&\geq \underbrace{(\lg n) + (\lg(n-1)) + \ldots + (\lg(n/2))}_{n/2 \text{ terms}} \\
&\geq \underbrace{(\lg n/2) + (\lg(n/2)) + \ldots + \lg(n/2)}_{n/2 \text{ terms}} \\
&= (n/2)\lg(n/2) \\
&\in \Omega(n \lg n)
\end{aligned}$$

12-11: **Sorting Lower Bound**

- All comparison sorting algorithms can be represented by a decision tree with $n!$ leaves
- Worst-case number of comparisons required by a sorting algorithm represented by a decision tree is the height of the tree
- A decision tree with $n!$ leaves must have a height of at least $n \lg n$
- All comparison sorting algorithms have worst-case running time $\Omega(n \lg n)$

12-12: **Counting Sort**

- Sorting a list of n integers
- We know all integers are in the range $0 \ldots m$
- We can potentially sort the integers faster than $n \lg n$
- Keep track of a "Counter Array" C:
  - $C[i]$ = # of times value i appears in the list

Example: 3 1 3 5 2 1 6 7 8 1

1	2	3	4	5	6	7	8	9

12-13: **Counting Sort Example**

3135216781

0	0	0	0	0	0	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-14: **Counting Sort Example**

135216781

0	0	0	1	0	0	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-15: **Counting Sort Example**

35216781

0	1	0	1	0	0	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-16: **Counting Sort Example**

5216781

0	1	0	2	0	0	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-17: **Counting Sort Example**

216781

0	1	0	2	0	1	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-18: **Counting Sort Example**

16781

0	1	1	2	0	1	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-19: **Counting Sort Example**

6781

0	2	1	2	0	1	0	0	0	0
0	1	2	3	4	5	6	7	8	9

12-20: **Counting Sort Example**

781

0	2	1	2	0	1	1	0	0	0
0	1	2	3	4	5	6	7	8	9

12-21: **Counting Sort Example**

81

0	2	1	2	0	1	1	1	0	0
0	1	2	3	4	5	6	7	8	9

12-22: **Counting Sort Example**

1

0	2	1	2	0	1	1	1	1	0
0	1	2	3	4	5	6	7	8	9

12-23: **Counting Sort Example**

0	3	1	2	0	1	1	1	1	0
0	1	2	3	4	5	6	7	8	9

12-24: **Counting Sort Example**

0	3	1	2	0	1	1	1	1	0
0	1	2	3	4	5	6	7	8	9

1 1 1 2 3 3 5 6 7 8 12-25: $\Theta()$ **of Counting Sort**

- What its the running time of Counting Sort?
- If the list has n elements, all of which are in the range $0 \ldots m$:

12-26: $\Theta()$ **of Counting Sort**

- What its the running time of Counting Sort?
- If the list has n elements, all of which are in the range $0 \ldots m$:
  - Running time is $\Theta(n + m)$
- What about the $\Omega(n \lg n)$ bound for all sorting algorithms?

12-27: $\Theta()$ **of Counting Sort**

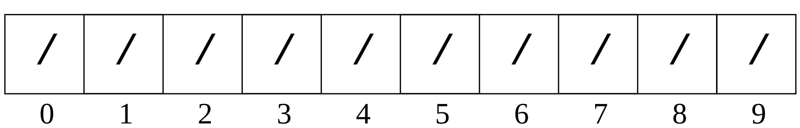
- What its the running time of Counting Sort?
- If the list has n elements, all of which are in the range $0 \ldots m$:
  - Running time is $\Theta(n + m)$
- What about the $\Omega(n \lg n)$ bound for all sorting algorithms?
  - For *Comparison Sorts*, which allow for sorting arbitrary data. What happens when m is very large?

12-28: **Binsort**

- Counting Sort will need some modification to allow us to sort *records* with integer keys, instead of just integers.
- Binsort is much like Counting Sort, except that in each index i of the counting array C:
  - Instead of storing the *number* of elements with the value i, we store a *list* of all elements with the value i.

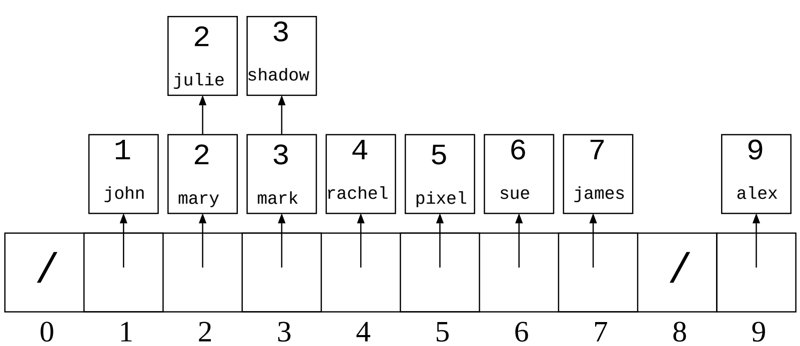
12-29: **Binsort Example**

3	1	2	6	2	4	5	3	9	7	key
mark	john	mary	sue	julie	rachel	pixel	shadow	alex	james	data



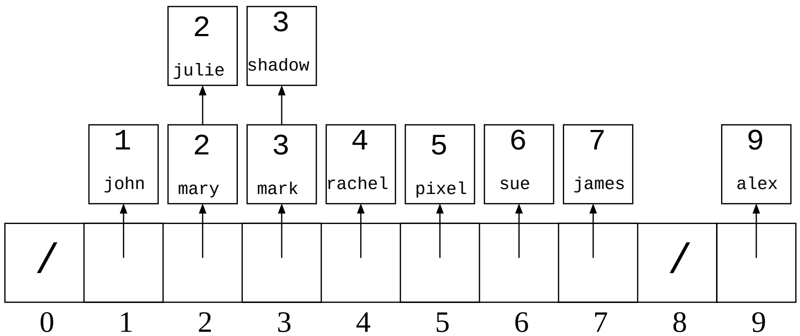
12-30: **Binsort Example**

3	1	2	6	2	4	5	3	9	7	key
mark	john	mary	sue	julie	rachel	pixel	shadow	alex	james	data



12-31: **Binsort Example**

1	2	2	3	3	4	5	6	7	9	key
john	mary	julie	mark	shadow	rachel	pixel	sue	james	alex	data

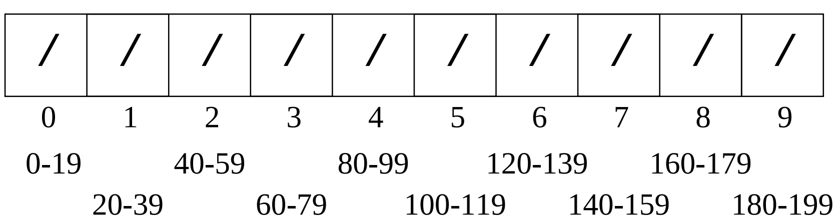


12-32: **Bucket Sort**

- Expand the “bins” in Bin Sort to “buckets”
- Each bucket holds a range of key values, instead of a single key value
- Elements in each bucket are sorted.

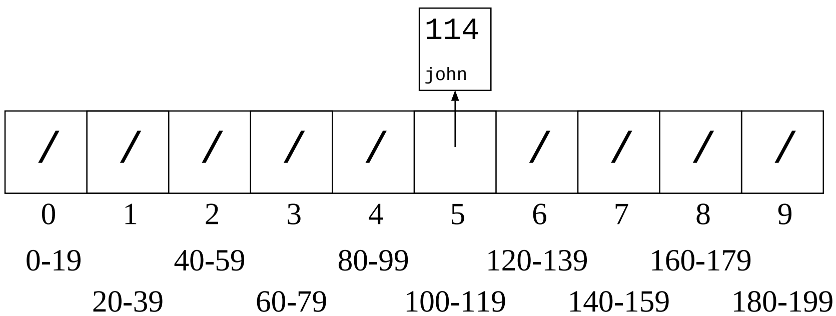
12-33: **Bucket Sort Example**

114	26	50	180	44	111	4	95	196	170	key
john	mary	julie	mark	shadow	rachel	pixel	sue	james	alex	data



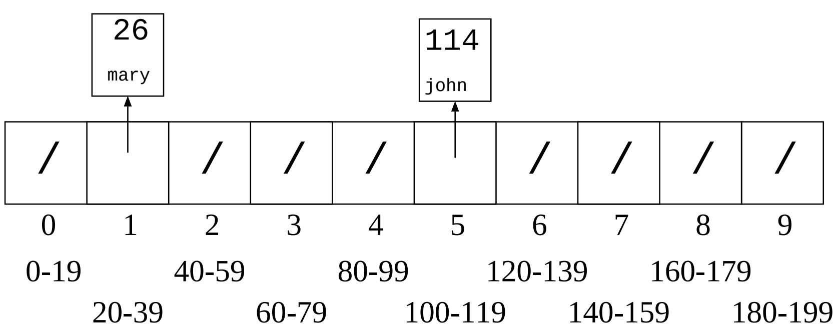
12-34: **Bucket Sort Example**

	26	50	180	44	111	4	95	196	170	key
	mary	julie	mark	shadow	rachel	pixel	sue	james	alex	data

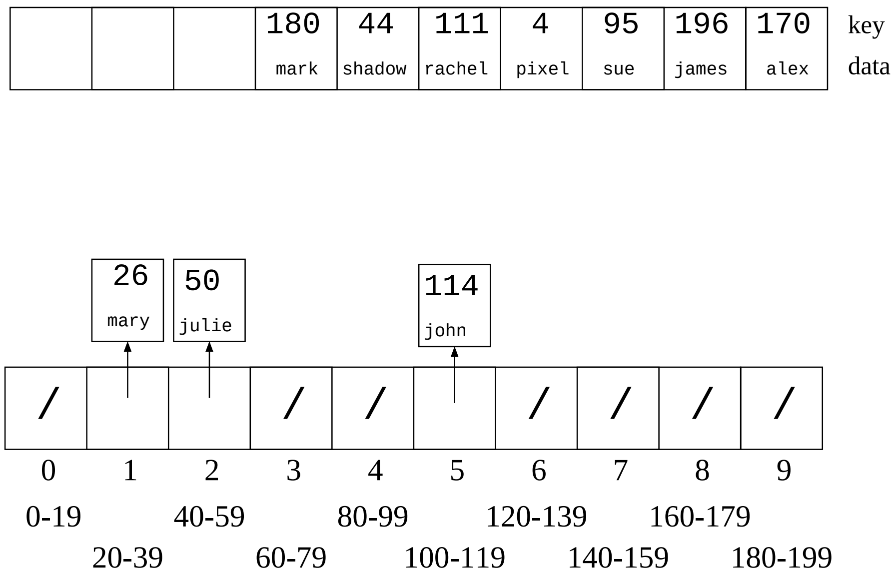


12-35: **Bucket Sort Example**

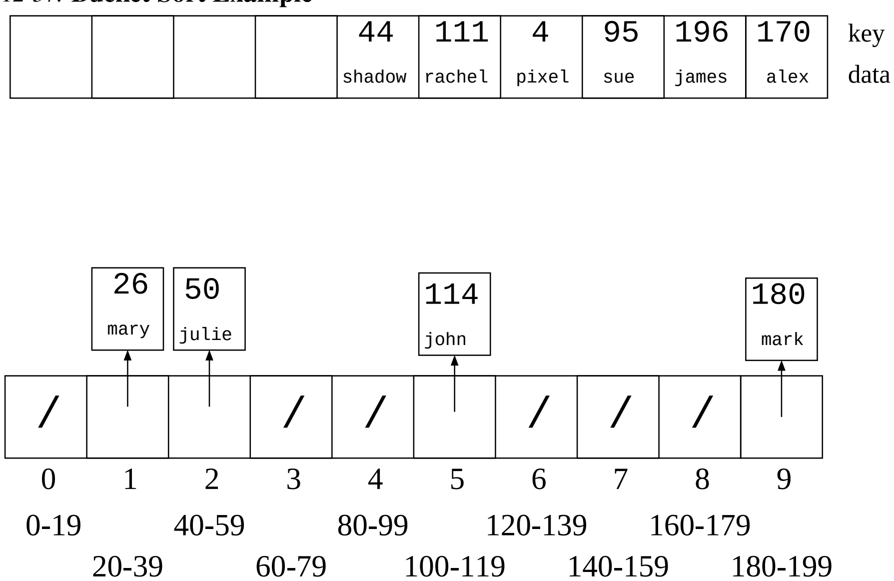
		50	180	44	111	4	95	196	170	key
		julie	mark	shadow	rachel	pixel	sue	james	alex	data



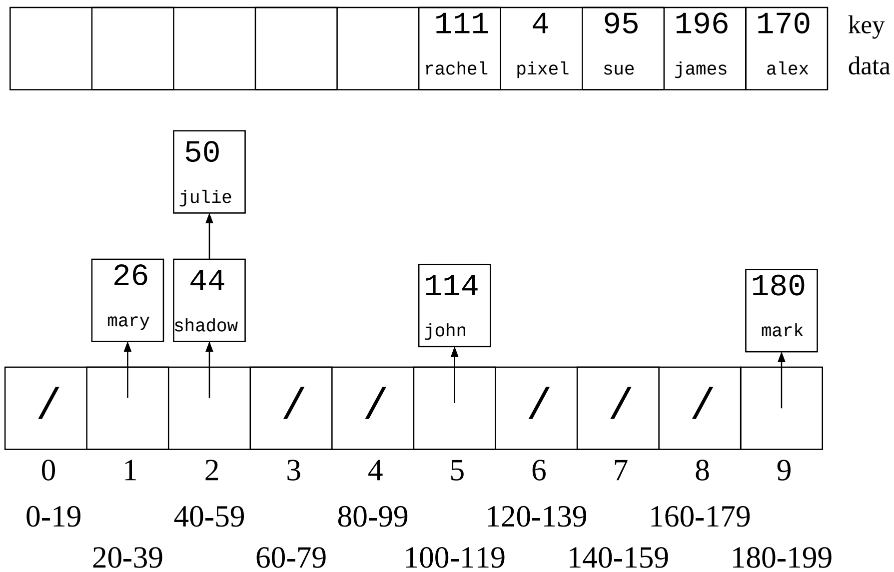
12-36: **Bucket Sort Example**



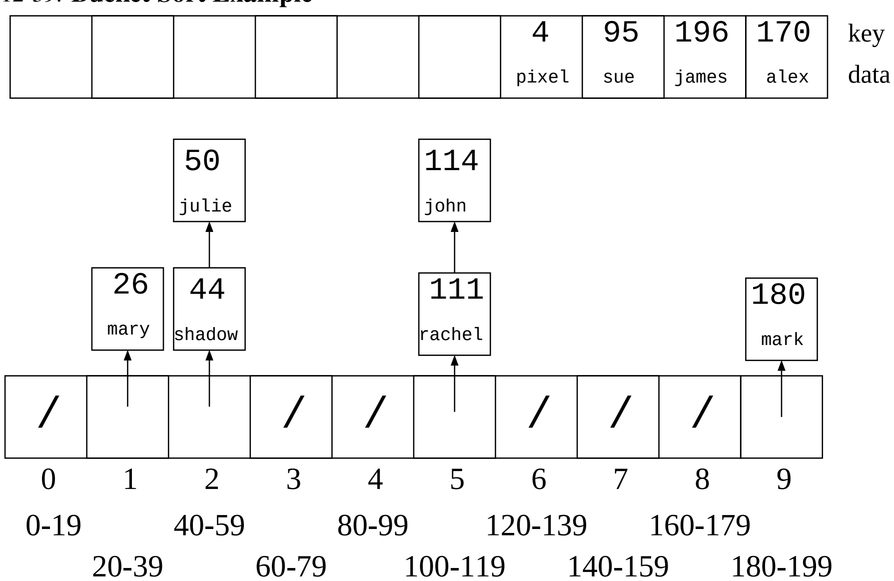
12-37: **Bucket Sort Example**



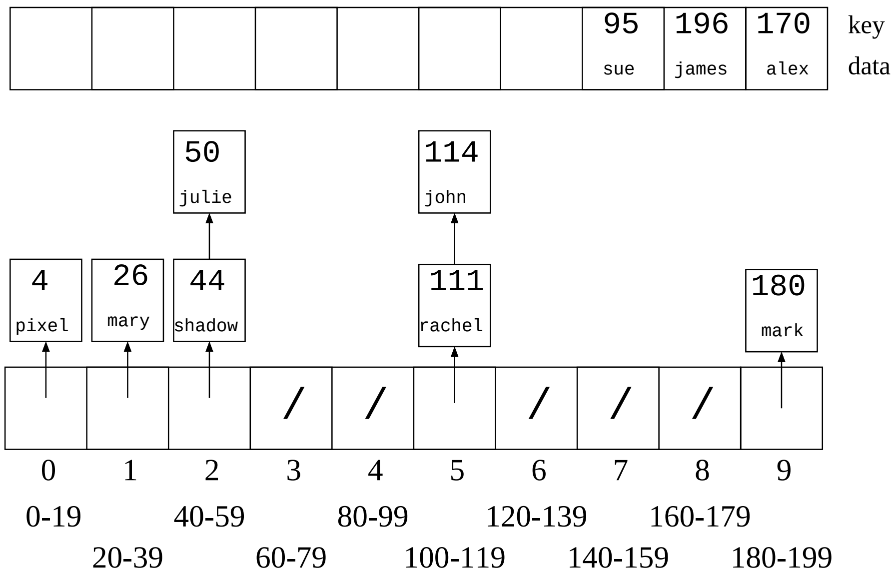
12-38: **Bucket Sort Example**



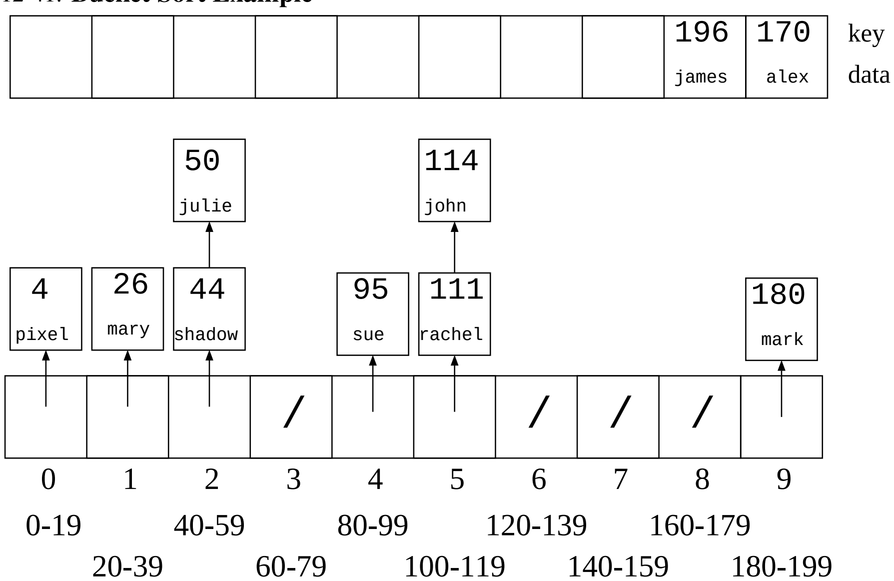
12-39: **Bucket Sort Example**



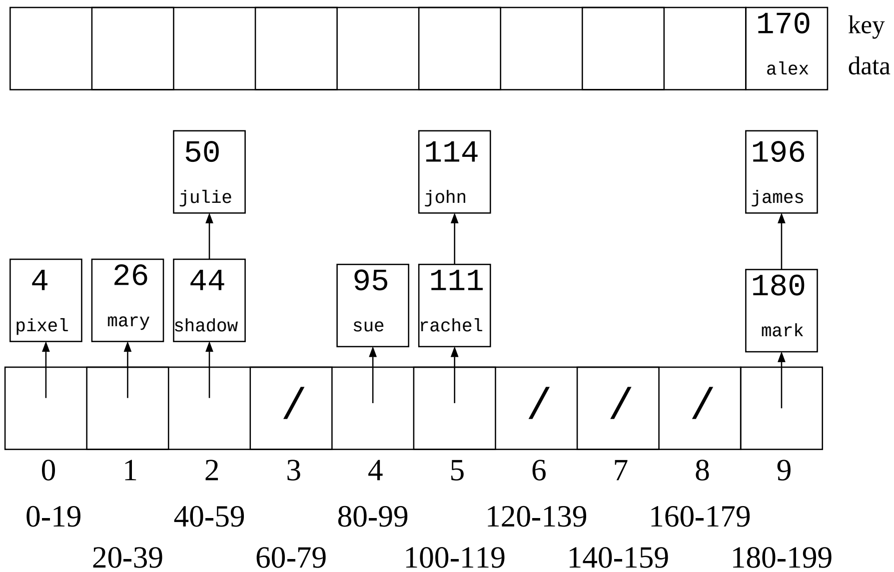
12-40: **Bucket Sort Example**



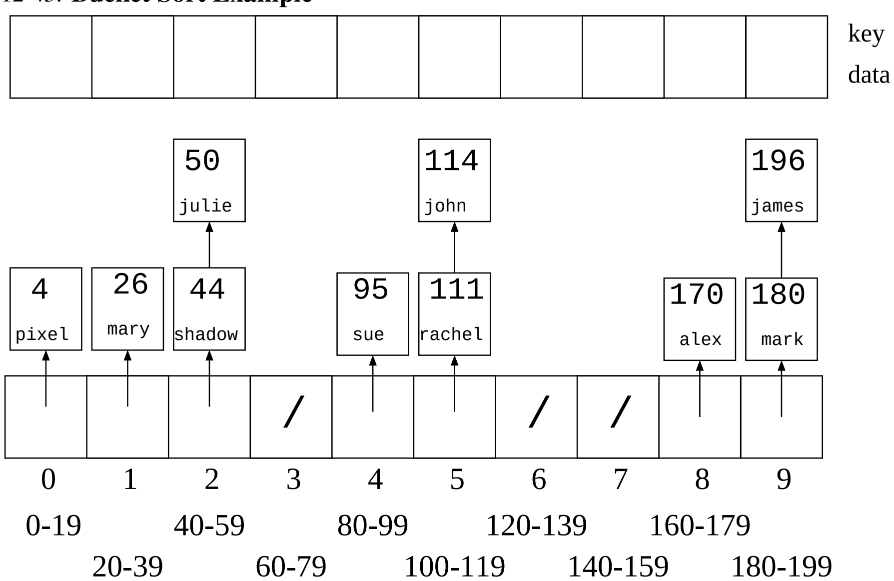
12-41: **Bucket Sort Example**



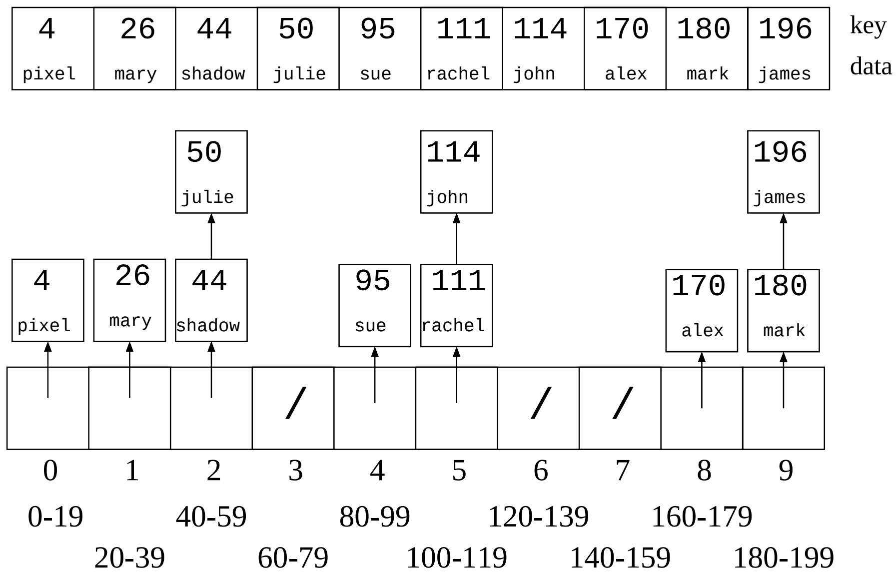
12-42: **Bucket Sort Example**



12-43: **Bucket Sort Example**



12-44: **Bucket Sort Example**



12-45: **Counting Sort Revisited**

- We're going to look at counting sort again
- For the moment, we will assume that our array is indexed from $1 \ldots n$ (where n is the number of elements in the list) instead of being indexed from $0 \ldots n-1$, to make the algorithm easier to understand
- Later, we will go back and change the algorithm to allow for an index between $0 \ldots n-1$

12-46: **Counting Sort Revisited**

- Create the array $C[]$, such that $C[i] =$ # of times key i appears in the array.
- Modify $C[]$ such that $C[i] =$ the *index* of key i in the sorted array. (assume no duplicate keys, for now)
- If $x \notin A$, we don't care about $C[x]$

12-47: **Counting Sort Revisited**

- Create the array $C[]$, such that $C[i] =$ # of times key i appears in the array.
- Modify $C[]$ such that $C[i] =$ the *index* of key i in the sorted array. (assume no duplicate keys, for now)
- If $x \notin A$, we don't care about $C[x]$

```
for(i=1; i<C.length; i++)
  C[i] = C[i] + C[i-1];
```

- Example: 3 1 2 4 9 8 7

12-48: **Counting Sort Revisited**

- Once we have a modified C, such that $C[i] =$ index of key i in the array, how can we use C to sort the array?

12-49: **Counting Sort Revisited**

- Once we have a modified C, such that $C[i]$ = index of key i in the array, how can we use C to sort the array?

```
for (i=1; i <= n; i++)
   B[C[A[i].key()]] = A[i];
for (i=1; i <= n; i++)
   A[i] = B[i];
```

- Example: 3 1 2 4 9 8 7

12-50: **Counting Sort & Duplicates**

- If a list has duplicate elements, and we create C as before:

```
for(i=1; i <= n; i++)
   C[A[i].key()]++;
for(i=1; i < C.length; i++)
  C[i] = C[i] + C[i-1];
```

  What will the value of $C[i]$ represent?

12-51: **Counting Sort & Duplicates**

- If a list has duplicate elements, and we create C as before:

```
for(i=1; i <= n; i++)
   C[A[i].key()]++;
for(i=1; i < C.length; i++)
  C[i] = C[i] + C[i-1];
```

  What will the value of $C[i]$ represent?

  - The *last* index in A where element i could appear.

12-52: **(Almost) Final Counting Sort**

```
for(i=1; i <= n; i++)
   C[A[i].key()]++;
for(i=1; i < C.length; i++)
  C[i] = C[i] + C[i-1];

for (i=1; i <= n; i++) {
   B[C[A[i].key()]] = A[i];
   C[A[i].key()]--;
}
for (i=1; i <= n; i++)
   A[i] = B[i];
```

- Example: 3 1 2 4 2 2 9 1 6

12-53: **(Almost) Final Counting Sort**

```
for(i=1; i <= n; i++)
   C[A[i].key()]++;
for(i=1; i<C.length; i++)
  C[i] = C[i] + C[i-1];

for (i=1; i <= n; i++) {
   B[C[A[i].key()]] = A[i];
   C[A[i].key()]--;
}
for (i=1; i <= n; i++)
   A[i] = B[i];
```

- Example: 3 1 2 4 2 2 9 1 6
- Is this a Stable sorting algorithm?

12-54: **(Almost) Final Counting Sort**

```
for(i=1; i <= n; i++)
   C[A[i].key()]++;
for(i=1; i < C.length; i++)
  C[i] = C[i] + C[i-1];

for (i = n; i>=1; i++) {
   B[C[A[i].key()]] = A[i];
   C[A[i].key()]--;
}

for (i=1; i < n; i++)
   A[i] = B[i];
```

- How would we change this algorithm if our arrays were indexed from $0 \ldots n-1$ instead of $1 \ldots n$?

12-55: **Final (!) Counting Sort**

```
for(i=0; i < A.length; i++)
  C[A[i].key()]++;
for(i=1; i < C.length; i++)
  C[i] = C[i] + C[i-1];

for (i=A.length - 1; i>=0; i++) {
   C[A[i].key()]--;
   B[C[A[i].key()]] = A[i];
}

for (i=0; i < A.length; i++)
   A[i] = B[i];
```

12-56: **Radix Sort**

- Sort a list of numbers one digit at a time
    - Sort by 1st digit, then 2nd digit, etc

- Each sort can be done in linear time, using counting sort

- First Try: Sort by most significant digit, then the next most significant digit, and so on
  - Need to keep track of a lot of sublists

12-57: **Radix Sort** Second Try:

- Sort by *least significant* digit first
- Then sort by next-least significant digit, using a Stable sort

  . . .

- Sort by most significant digit, using a Stable sort

At the end, the list will be completely sorted. Why?

12-58: **Radix Sort**

- If (most significant digit of x) ¡
  (most significant digit of y),

  then x will appear in A before y.

12-59: **Radix Sort**

- If (most significant digit of x) ¡
  (most significant digit of y),

  then x will appear in A before y.
  - Last sort was by the most significant digit

12-60: **Radix Sort**

- If (most significant digit of x) ¡
  (most significant digit of y),

  then x will appear in A before y.
  - Last sort was by the most significant digit
- If (most significant digit of x) =
  (most significant digit of y) and

  (second most significant digit of x) ¡
  (second most significant digit of y),

  then x will appear in A before y.

12-61: **Radix Sort**

- If (most significant digit of x) ¡
  (most significant digit of y),

  then x will appear in A before y.
  - Last sort was by the most significant digit
- If (most significant digit of x) =
  (most significant digit of y) and

  (second most significant digit of x) ¡
  (second most significant digit of y),

  then x will appear in A before y.
  - After next-to-last sort, x is before y. Last sort does not change relative order of x and y

12-62: **Radix Sort**

Original List

982	414	357	495	500	904	645	777	716	637	149	913	817	493	730	331	201
