

CS 490: Senior Team Project

Managing Tasks/Issues

Lecture 3

Design

- Your group had the chance to choose their mini-project during last class.
- This most likely included some design elements, but now it's time to start thinking about the high-level design of your project.
- You won't know everything you need in advance, but start breaking the project down into components you will likely need.

Issues (Tasks)

- Github's *issue* tracker is how we'll manage your work this semester
 - Might be better named tasks/tickets/etc. instead of issues, but we don't make the rules here...
- A template for issues has been added to the schedule page
- As a group, after working on your design, begin creating issues to represent the individual pieces of functionality your project will need.
